

CTC MKWII Stats Website Documentation

This directory documents how the current Season 1 stats website is built, how data moves through it, where configuration lives, and what should change to support Season 2 historical analytics plus ongoing Season 3 updates.

Document Map

- [Architecture](#): high-level app structure and request/data flow.
- [Backend](#): Flask app, API endpoints, stats helper behavior, and known backend issues.
- [Frontend](#): React/Vite UI routes, components, assets, and API usage.
- [Data Pipeline](#): MKW Table Bot JSON input format, extraction process, CSV schema, and current maintenance workflow.
- [Deployment](#): Render, Railway, Docker, GitHub Pages, and local development notes.
- [Environment And Secrets](#): every observed environment variable, external service URL, and secret-like dependency.
- [Vision](#): proposed direction for Season 2 and live Season 3 maintainability.

One-Sentence Summary

The website is a React/Vite frontend that calls a Flask API; the Flask API reads pre-generated CSV files created from MKW Table Bot JSON match files and returns rankings, averages, and comparison lists.

Current State

The codebase is centered on Season 1. Data is split by division:

- `backend/CSV/ctc_d1_2.csv`
- `backend/CSV/ctc_d3.csv`
- `backend/CSV/ctc_d4.csv`

The original JSON/text match files live under:

- `backend/JSON/ctc_s1_d1_2/`
- `backend/JSON/ctc_s1_d3/`
- `backend/JSON/ctc_s1_d4/`

The current app has no upload UI, no database, and no automatic pipeline trigger. New data must currently be added to the repo and converted into CSV manually or with a script call.
